

Admiral Fitzroy was the first to introduce accurate weather forecasting in Great Britain.

This case kit is taken from one of Fitzroy's earlier simple designs and is available cherry or oak.

The component kit contains a 34-inch (863.6 mm) tube of mercury with mounting brackets, a spirit thermometer measuring 7-3/4" x 1/16" (196.9 mm x 30 mm) and a sealed storm bottle with mounting brackets.

The storm bottle is a curious device some say was invented by accident more than 200 years ago during an alchemist's experiment with a solution of potassium nitrate ammonium chloride, camphor and distilled water. Contained in a sealed glass tube the mixture is a simple visual weather indicator. Particles in the liquid rise and become crystalline or cloudy as the weather deteriorates. The higher they rise, the worse the weather. The three instruments are mounted on back paper, which carries Fitzroy's own wording and two brass moveable indicator pointers showing the barometric pressure at any given time.

**Height 47.5" (12065 mm)
 Width 8.875" (227 mm)
 Depth 4" (102 mm)
 Weight for component Kit WFC0:
 5 lbs. (1.1 kg.)
 Weight for complete kit 22 lbs.
 (10 kg.)**
